

Internal & External Coating Ponca City, OK

A major wastewater treatment facility contacted HMT regarding rehabilitation of two eighty foot diameter clarifier tanks. They were interested in coating all of the carbon steel in both the immersion and non-immersion zones.

HMT sandblasted, performed the surface preparation and applied the appropriate coatings for the project. The scope of work included the clarifier walls, the coating of the clarifier rake arms, center column, scum trough and the bridge.

The project was completed without safety or environmental incident, on time and within budget. Commendations were received from the client.
